## **Preface**

### ALASKA POPULATION OVERVIEW

Alaska Population Overview provides a demographic portrait of the people of the State of Alaska in their ever-changing numbers. The goal is to provide a wide variety of frequently requested population information in a single publication. Data presented here are for the resident population of Alaska. All July 1, 1991-99 population estimates represent an annual average population for each year rather than the population on July 1. Seasonal populations in parts of Alaska may be higher than the annual average permanent resident population. Readers should note that the entire time series for population is updated each year so that time series information should be taken from the most recent publication rather than adding the most current year's estimate to that published previously.

This edition of *Alaska Population Overview* consists of four chapters, which include current and historical estimates for the state, its boroughs and census areas and places, as well as information and data from the April 1, 1990, U.S. Census of Population and Housing. The population concepts and definitions used here are the same as those used by the United States Bureau of the Census at the time of the 1990 census. Terms and concepts are defined in a glossary found at the end of this publication.

### **Population Publications**

Other publications supplement the Alaska Population Overview. Specialized demographic information is available in the Demographic Report Series. The first in this series was Alaska Life Tables for 1977-83. Number two in this series is Modified Age, Race, Sex Estimates (MARS), 1990. This publication contains estimates that correct the age, race and male/female statistics from the 1990 census for a severe mistabulation of persons under one year of age (age heaping) and Office of Management and Budgetconsistent race estimates. These eliminate the "Other Races" category and provide for Hispanic and Non-Hispanic estimates of White; Black; American Indian, Eskimo and Aleut; and Asian and Pacific Islanders. Comparisons are made between the MARS estimates and the 100% and sample 1990 census counts. All age, race, male/female estimates used in Alaska Population Overview are consistent with MARS estimates. Future demographic reports will update the Life Tables, and provide revised 1990-2000 inter-census and historical estimates of components of population change for Alaska.

Because of reductions in funding, *Alaska Population Projections* will not be produced this year.

### **Accuracy**

While estimates in this publication are published in unrounded form for ease of use in other computations, the reader should NOT assume that estimates are accurate to the last digit. In general, the state estimate is assumed to be accurate to the nearest thousand and borough and census area estimates to the nearest hundred.

### **Acknowledgments**

Thanks go to Dean Rasmussen, Labor Economist with the Demographics Unit, in the preparation of this issue and to Jo Ruby, soon departing her job, who for several years has done this publication layout for *Population Overview*. Special acknowledgment is given to the Office of the Lieutenant Governor, Division of Elections; to the Vital Statistics and Nursing sections of the Division of Public Health, and the Division of Family and Youth Services of the Department of Health and Social Services; and to the Alaska Departments of Education, Revenue, and Community and Economic Development for their aid in regularly providing information essential to the production of these estimates.

In addition, thanks go to numerous individuals in city and borough governments and small communities, schools, businesses and Alaska Native regional corporations who help keep us up to date on ongoing population changes. Special thanks also go to the personnel departments of the Army, Air Force, Navy and Coast Guard in Alaska for the statistics they provide each year to the Alaska Department of Labor and Workforce Development.

Comments or suggestions regarding the content or format of this publication are welcome. Many of the most requested statistics found here may also be found on the Research and Analysis web site at: http://www.labor.state.ak.us/research/research.htm.

Requests for demographic estimates and projections information should be addressed to Greg Williams, Research and Analysis Section, Alaska Department of Labor and Workforce Development, P.O. Box 25501, Juneau, Alaska, 9980-5501. Telephone: (907) 465-6029; FAX: (907) 465-4506; email: Greg Williams@labor.state.ak.us.

## Introduction

### ALASKA POPULATION OVERVIEW

### **Demographic Programs**

The Demographics Unit of the Alaska Department of Labor and Workforce Development, Research and Analysis Section, is Alaska's representative to the Federal/State Cooperative Program for Population Estimates (FSCPE) and the Federal/State Cooperative for Population Projections (FSCPP) programs with the U.S. Bureau of the Census. Data from a wide range of state administrative records are compiled and maintained by FSCPE agencies. The Demographics Unit also prepares and reviews various estimates at the state, county and sub-county geographic levels. The FSCPE program is the only federally accepted source of population estimates made between the censuses that are conducted every 10 years. The Research and Analysis Section also contains a third, separate federal/state cooperative program, the State Data Center, whose function is the dissemination of U.S. census statistics, geography and other information from the U.S. Bureau of the Census.

The ongoing FSCPE program, along with the State Data Center program, also play a critical role in the U.S. Year 2000 decennial census. R&A reviews census plans to insure that they are appropriate for Alaska and reviews preliminary census results for error. A good decennial census helps to insure that Alaska's share of federal funding is maintained through the decade and that estimates are generated from an accurate population base.

### Demographics for Equal Allocation

Demographic statistics play an essential role in making decisions about the best way to spend scarce resources in government, business, and private nonprofit organizations. Government's use of demographic statistics helps insure democratic distribution of resources to the public at large or a segment of the public that is the focus of a specific program. Private nonprofits use demographic

statistics to identify the special interest clients to be served. In business, demographics function to direct resources in order to increase profits.

For the framers of the U.S. Constitution, equal representation was a keystone of democracy. Fair and equal access of every American to resources and services is an underlying principle of American government. Because federal, state and local funds are limited, the possibility of one group or community getting a disproportionate share of resources designated for all undercuts the principles of democracy. For this reason, up-to-date population estimates are essential for the allocation of funds and services at every level of government. Demographic statistics are frequently used to insure equal access to jobs, housing, education, wages and representation. Some examples include Equal Employment Opportunity/Affirmative Action laws, voting rights act compliance, and jury selection. Equal access to funding occurs through per capita distribution. Funds for many government programs are distributed solely on a per capita basis. Services such as liquor licenses are also regulated on a per capita basis. Some governmental and private nonprofit programs, however, are directed at a particular sub-group of the population who meet an eligibility requirement. For example, programs may also be targeted by geography, such as those for residents of low-income neighborhoods. The more specific the targeting, the more detailed the population and geography data needed to insure that funds serve those for whom they were intended.

Targeting uses population statistics for market segmentation. To be eligible for targeted funds or services may mean having a specific characteristic such as being of school age, elderly, poor or handicapped. Another type of minimal eligibility applies to licenses and regulations for communities of

a given size. For example, Alaska plumbing and electrical codes do not apply to very small communities. Funding for mass transit programs may be available only for larger communities. Banks and businesses typically evaluate community size to determine if there is sufficient market for a business, service or level of bonding.

Targeting may also be done on a geographic basis. Business and government use demographic statistics to locate facilities. Manufacturing plants, banks, landfills, stores and the location of offices for business, government and private nonprofit service areas all depend on the location of some population relative to the facility. Assessing demand placed upon natural resources and wildlife often depends on the geographic distribution of both population and resources. One example is bowhead whale allocations to Alaska's northern coastal villages.

### **Demographics for Decisions**

There are two key uses of demographics for decision making. The first is determining populations at risk for purposes of rate computation (i.e., birth rates, death and disease rates, teen pregnancy rates, crime rates). Such rates quantify the existence of a problem and its severity. Rates are necessary to compare the number of persons at risk in Alaska to the number at risk elsewhere. The second is the extensive use now made of sample surveys. Such surveys are valid only when the characteristics of the survey universes are known. This requires a variety of demographic statistics for the area being surveyed.

Making good decisions in any activity requires knowledge of the character and history of that activity. Statistics that describe characteristics, geographic distribution and trends provide an essential part of that knowledge. Analysis of trends and projections attempts to assess the impact of different possible courses of action. News and public media organizations also demand this information as part of their ongoing efforts to keep the public informed of the changes that affect the decisions they must make as citizens.

In certain fields, demographic information strongly affects decision-making on the part of government, private nonprofit organizations and businesses. These are: health and health care; community, social and human services; education; land use and real estate; environmental impact; economics, banking and financial services; manufacturing, wholesale and retail marketing; transportation and shipping; and travel and leisure services.

### Estimates and Federal Fund Allocation

As stated above, a critical use of demographic estimates is fund distribution. In FY98, \$5.7 billion in federal money came to Alaska in the form of salaries, retirement benefits, loans, direct payments to individuals and general government programs. This was \$0.28 billion more than in FY97. Of the 451 federal programs that provided money to Alaska, some 374 general government programs and one direct payment program accounted for \$1.4 billion. About \$554.9 million, or 39.0%, of all general government federal dollars coming to Alaska have formulas that depend either directly or indirectly on population.

A few large programs accounted for the vast majority of all population formula dollars returned to Alaska in FY98. In millions of dollars, these were: Medicaid (\$261.1); Airport Improvement-State Apportionments (\$78.7); Unemployment Insurance (\$18.0); Head Start (\$18.0); Educationally Deprived Children-Local Education Agencies (\$17.3); Special Supplemental Food Program for Women, Infants and Children (WIC) (\$17.0); Job Training Partnership Act (\$15.3); Water and Waste Disposal Systems (\$11.6); Foster Care-Title IV (\$10.8); Wildlife Restoration-Hunter Safety and Education (\$8.6); Employment Service (\$8.3) and Child Support Enforcement (\$8.1). These 12 programs accounted for 85.2% of the federal formula dollars that were population dependent.

The next largest programs were, in millions of dollars: Rehabilitation Services-Basic Support (\$6.6); Social Service Block Grants (\$5.3); Community Development Block Grants-Entitlements (\$4.5); Vocational Education-Basic Grants to States (\$4.2); Home Investment in Affordable Housing (\$3.5); Rural Rental Assistance Payments (\$3.4); Community Development Block Grants-State Funding (\$3.1); Economic Development Grants For Public Works (\$3.0); Block Grants for Prevention and Treatment of Substance Abuse (\$2.9); Coastal Zone Management (\$2.7); Drug Free Schools and Communities (\$2.6); Special Programs for the Aging, Title III (\$2.4); and State and Local Narcotics Control Assistance (\$2.3). In total, programs of more than \$2.0 million account for 94.0% of all population-dependent federal dollars coming to Alaska.

By federal department, population-dependent program money, in millions of dollars, coming to Alaska was as follows: Department of Health and Human Services (\$319.8); Department of Transportation (\$82.7); Department of Labor (\$48.2); Department of Agriculture (\$32.3); Department of Education (\$33.2); Department of Interior (\$8.6); Department of Housing and Urban Development (\$11.0); Department of Commerce (\$6.3); Department of Justice (\$4.0); Environmental Protection Agency (\$3.5); Department of Energy (\$0.2) and Federal Emergency Management Agency (\$0.3).

### Estimates, Regulation and State Fund Allocation

Federal funding formulas are only one aspect of the impact of population on the distribution of federal dollars to the states. Population estimates are used by the Internal Revenue Service to provide credit ceilings for state bonds and by the Federal Election Commission to determine spending limits for presidential and congressional election campaigns. Program managers at the state level also use population statistics throughout the process of further distribution of federal dollars to local communities. These programs use ongoing state estimates for counties and localities, as well as complex social and economic demographic characteristics for further allocation.

Demographic statistics are also used to distribute state funds to local communities from state revenues. Population estimates play a key role in Alaska in distributing state funds to boroughs and municipalities. In FY2000, the Department of Community and Regional Affairs distributed some \$31.9 million through State Revenue Sharing and Municipal Assistance based upon population estimates and local censuses. In addition, population estimates play a major role in the allocation of quota share money from the Bering Sea Fishery through the Community Development Quota (CDQ) program to coastal villages.

Some 84 sections of the Alaska Statutes and 60 sections of the State Administrative Regulations reference population estimates or projections. Some of these cover areas such as: issuance and transfer of alcoholic beverage licenses, bank and savings and loan incorporation, state business licensing, Regional Education Attendance Area (REAA) school board sections, municipal government incorporation, municipal tax resource equalization, State Budget Reserve Fund appropriation limit, school capital improvements and construction bonding, capital budget submittal, and municipal oil and gas production property tax limitations.

# Chapter 1

### ALASKA STATE POPULATION

#### Introduction

This chapter discusses population trends for Alaska. It contains a section on the components of population change, which include births, deaths, and migration flows. There are discussions of the age, male/female and race composition as well.

#### The Census Base For Estimates

Estimates produced here follow the Census Bureau's definition of residency. The U.S. Bureau of the Census defines a resident as a person who resides in a place for at least six months of the year or has no other usual place of residence. Residents are defined in this way in order to avoid double counting. Foreign nationals who were resident aliens were counted in the U.S. communities in which they lived, as were college students and military personnel. Workers at remote sites, such as the North Slope and fish processing or lumber camps, are allowed to list their place of residence as someplace other than the work site. In 1980 and 1990, for example, most North Slope oil workers listed their place of residence as elsewhere in Alaska or out of state.

Estimates shown for July 1 actually represent annual average resident population rather than the population on that date. Employment in Alaska is highly seasonal in construction, fishing and seafood processing, logging, mining and tourism. At any point in time there are substantial numbers of nonresidents working in Alaska, primarily in seasonal jobs. During 1998, the most recent year for which information is available, 69,551 workers, or about 19.5% of all persons who worked at some time during that year in covered wage and salary employment, were nonresidents. This number, however, overstates the number of nonresidents in the state at any given point in time because these workers are present for varying periods of time. While exact estimates of nonresidents at any point in time during the year are not possible, the seasonal summer, non-tourist, nonresident population was equivalent to about eight percent of the resident population. In some communities, nonresident or seasonal workers may outnumber the permanent residents. The greater this seasonal population, the more difficult it is to accurately estimate the permanent population. Sometimes communities will attempt to count transient workers as residents. Since communities provide services to transient

populations, they often feel justified in claiming them as residents for revenue sharing purposes. Such populations do not, however, meet Census Bureau definitions for residency.

As in previous editions of Alaska Population Overview, this edition continues to include some frequently used 1990 census information. The 1990 census counted more persons as Alaska residents in fish processing and logging activity than were counted in 1980. United States ships in U.S. waters were also assigned to their port of origin or destination as of April 1, 1990. Ships' crews were considered as group quarters population. Persons living on board small craft were counted the same as persons living in houses or apartments. Crews of small fishing vessels were counted at their shorebased homes. Coast Guard ships were counted as group quarters in their home port. Because the 1990 census created census block numbering areas and tracts for all of the U.S., it is now possible to identify commercial ships' populations for any port. In 1980, these populations could be identified only for Anchorage, Juneau, and Cordova.

Vessels attributed to Alaska ports accounted for 2,066 persons in the 1990 census in Alaska, or 0.4% of the state's population. These ships contributed a significant portion of population to a number of the state's boroughs and census areas. In the Aleutians West Census Area, for example, crews from these ships accounted for 11.2% of the population; in Aleutians East Borough, 7.6%; in Kodiak Island Borough, 3.1%; and in Valdez-Cordova Census Area, 2.9% of the population. In communities, moreover, these vessels had an even larger impact. Their crews comprised significant proportions of the population in the following communities: Unalaska, 31.7%; Akutan, 31.7%; Kodiak Station, 13.1%; St. Paul, 10.4%; Valdez, 5.6%; Cordova, 2.9%; City of Kodiak, 2.2%; and Homer, 1.4%. In a number of these communities, the ships represented a very transient population that was not necessarily found there after the spring of 1990.

### **Population Trends**

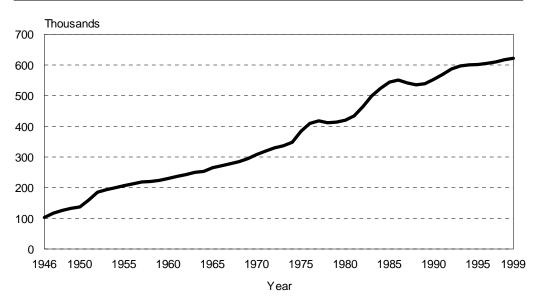

The provisional July 1, 1999, Alaska resident population was estimated to be 622,000, or 0.2% of the population of the U.S. The 1999 resident population of the United States, excluding territories

and military overseas, was 272,878,000. The U.S. is comprised of 50 states, plus the District of Columbia. Alaska in 1999 ranked 48th in population. Wyoming, with a population of 479,602; the District of Columbia, with a population of 519,000; and Vermont, with a population of 593,740, have fewer people. North Dakota with an estimate of 633,666 is the next larger state in population.

The land area of Alaska covers 570,374 square miles; water area is 86,051 square miles. Alaska has 16.1% of the land area of the U.S. and 34.3% of the water area. In spite of its low population density of 1.1 persons per square mile, Alaska population in 1999 was 70.4% urban. This means that more than seven out of 10 persons lived in places of 2,500 persons or more. In 1999, the U.S. averaged 77.2 persons per square mile, and was 75.2% urban in 1990. Excluding Anchorage, which contains 42.5% of the state's population but only 0.3% of the land area, Alaska averaged 0.64 person per square mile. Most Alaskans live in towns and villages or clustered settlements.

As discussed in Chapter 4, most of the state's land area is in federal and state parks, forests, wetlands, wildlife and wilderness preserves, Alaska Native Corporation lands, and 5,000 glaciers. Excluding these areas, most of which place exclusions or restrictions on settlement, only about one percent of the state's land is in other private ownership. In all, these private holdings amount to an area about 20 percent larger than the state of Massachusetts or the state of New Jersey, and a fair amount of this land is inaccessible or unusable for settlement.

Figure 1.1 Alaska Population Trends, 1946-1999

Source: Alaska Department of Labor and Workforce Development, Research and Analysis Section, Demographics Unit.

Consequently, most of Alaska shows settlements of moderate density surrounded by large tracts of uninhabited land.

### Alaska Population History

The population of Alaska was quite small before the gold rush in the 1880s. Early territorial censuses were incomplete. The first census in 1880 counted only 33,426 persons. The gold rush doubled the state's population between 1890 and 1900. Following the turn of the century, the population of Alaska remained stable for the next 40 years. The 1900 population was reported at 63,592, but by 1939, the population slipped to 59,278. The state's gold production had declined, and much of the state at that time remained inaccessible.

World War II brought the construction of the Alcan Highway. The result was dramatic growth of the state's population as shown in Table 1.1 and Figure 1.1. The war and Alcan construction played a key role in the development of both Anchorage and Fairbanks. Although the military share of the state's population has declined since World War II, it continues to play a substantial role. In 1990, about 10 percent of the population was made up of military and dependents; by 1999, they accounted for only seven percent.

Alaska's population grew rapidly from the end of World War II to 1952. The average annual rate of increase was 9.5% per year. The population grew at a slower, smoother pace from 1952 to 1965, with an average annual rate of change of 2.7% per year.

Alaska had approximately 224,000 people at the time of statehood in 1959. From 1965 to 1973, population growth rate gradually increased to 3.0% per year.

The building of the 800-mile trans-Alaska oil pipeline dramatically affected population growth in the 1970s. The pipeline linked the giant North Slope oilfield of Prudhoe Bay with the oil terminal shipping facilities at Valdez. Construction began in 1973 and peaked in 1975, with a migration gain of over 30,000 persons. The average annual rate of population change during this period leaped to 6.6% per year. At the completion of pipeline construction, the boom was followed by a recession during the 1977-80 period. The result was a population loss of about 6,400

Table 1.1
Annual Components of Population Change for Alaska, 1945-1999

			Average	Components of Change					
July 1 to June 30	End of Period Population	Population Change	Annual Rate of Change (%)	Births	Birth Rate /1,000	Deaths	Death Rate /1,000	Natural Increase	Net Migrants

<sup>\*</sup> Provisional

Note: Revisions of Alaska's state population are due to revisions in Alaska's vital statistics and Permanent Fund data.

people between 1977 and 1978. The net loss of people due to out-migration in that year was more than 13,400. The annual rate of change over the four-year period, however, averaged a positive 0.6% per year.

Between mid-1980 and mid-1985, Alaska experienced its largest economic boom. Rapid growth resulted from construction and infrastructure development fueled by a combination of state spending based on oil revenues, major federal expenditures, and private development. As a result, Alaska's population grew by a phenomenal 25% in five years, making it the most rapidly growing state in the nation. The most growth occurred in the 1981-83 period during which the annual rate of change averaged 6.8% per year. The pace of growth began to slow during 1983-84, with a rate of change of 4.8%, and declined further in 1984-85 to 3.6%.

From 1985-89, Alaska experienced a recession similar to that of 1977-80, but more severe, as a result of falling oil prices combined with declining crude oil production. During the period of the retrenchment in 1986-87, population declined at the rate of 1.8%. The cumulative loss of persons to net out-migration in the period 1985-89 was about 45,900 persons, as compared to a net out-migration of 20,400 during the post-pipeline period. This population loss was equal to about 8.3% of the state's peak 1986 population. This loss would be proportionally equivalent to the loss of Spokane to the state of Washington or the loss of the San Diego metropolitan statistical area to California. By 1989, net out-migration slowed enough to allow the natural increase of births over deaths to produce the first increase in population since 1986. In the final analysis, the average annual rate of population increase for Alaska during the period from July 1, 1980, to July 1, 1990, was 2.8%, whereas for the United States during that period change averaged just 0.9% per year.

Between 1990-1999, the state's population continued to increase. Population growth averaged 1.3% annually, ranging from a low increase of 0.2% between 1994-95 to a high of 3.5% between 1990-91. Between 1993 and 1997, it was natural population increase, or more births than deaths, that provided the major stimulus for growth. Alaska still has one of the highest rates of natural increase in the nation, but as in the nation as a whole, birth rates are currently falling. Because of the substantial declines in military and dependent population due to base closures and reorganizations during this period, Alaska experienced a rather protracted period of net emigration. The military movements were large enough to offset any civilian in-migration during this period. Most recently, the extremely good economic opportunities in the states which have traditionally

provided most of Alaska's migrants, combined with Alaska's lack of growth in income and the continued high cost of living, have dampened in-migration to the state relative to levels seen in the late 1980s.

### **Factors Which Influence Change**

The overall prosperity of Alaska in terms of revenues, as in the past, remains heavily dependent upon demand for its natural resources both at home and abroad. Government spending and policy decisions also have a substantial effect on the economy and population growth in Alaska. Government remains Alaska's largest employer. In 1999, close to a third of Alaska's labor force was directly employed by the military, federal, state, and local government. Reductions in military and other federal spending, reduction of state operating revenues, and loss of revenue sharing to local communities are all part of a trend that has slowed Alaska's economy and overall population growth. The largest positive growth sector in employment during the 1990s has been in the service sector.

Major expenditures on privately funded, federal- and state-sponsored construction, while beneficial to the state's economy in the short term, generally cause only a temporary surge in population. Rapid expansion is likely to be followed by an economic downturn. Alaska, like most western states, is likely to continue to exhibit a "boom-bust" element in its economy for many years to come.

Alaska's population has increased six-fold since 1946. Despite fluctuations in population growth in Alaska, the overall trend during the post-World War II period has been one of strong positive growth. While Alaska is currently progressing towards a more stable and balanced type of economic growth, its economy is still largely dependent on natural resources, especially oil.

The physical resources of this state will continue to be unique. Demand to extract Alaska minerals such as oil, gas, gold, and coal should remain strong despite recent market declines. Fishing and forestry will continue to play a modest and probably declining role in Alaska's future. Tourism continues strong and brings demands for increased access to the scenic beauty of the state. Beyond the economic considerations, the intangible quality of Alaska as a place of wilderness, beauty, and special way of life will continue to attract migrants to the last frontier.

### **Components of Change**

Population change is made up of natural increase (births minus deaths) and migration as shown in Table 1.1 and Figure 1.2. Natural increase is the fairly stable component of population change. Death

rates change very slowly, and while current fertility depends on a variety of factors, the general birth trend does not change direction quickly. Migration is the unstable component of population change in the state, often changing dramatically from one year to the next.

#### **Births and Deaths**

Nationwide fertility rates declined from the 1970s to mid 1980s. In the latter 1980s, this trend reversed. From a nationwide low in 1987 of 1.8 children per family, fertility increased to a 1990 high of 2.1 children per family. This increase was primarily the result of increased fertility for older baby boom women who had postponed marriage and childbearing. Alaska's fertility rate has always been well above the national average. In 1990, Alaska had one of the higher levels of fertility among the states, with 2.6 children per family. Decade trends in crude birth rates for Alaska, its boroughs and census areas can be seen in Table 2.3. Following a brief increase in birth rates around 1990, birth rates have declined somewhat in Alaska and nationwide. In 1999, Alaska's fertility remains at about 2.5 children per family, compared to 2.0 nationwide.

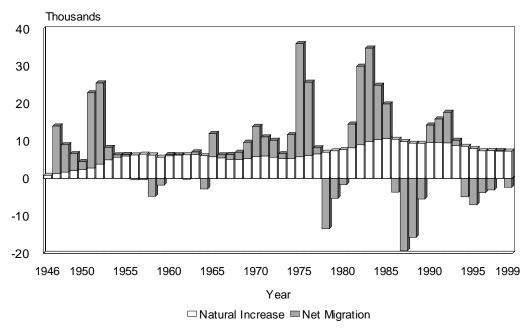

Between July 1, 1998 and July 1, 1999 an estimated 9,864 persons were born in Alaska and an estimated 2,564 persons died, a net natural increase of 7,300 persons. This translated into a growth rate of 0.8% as a result of natural increase. Births were equivalent to about 1.6% of the population. Approximately 0.4% of the population in Alaska died.

Most of the growth in Native American population was due to natural increase. Birth rates among Native Americans have traditionally been very high, but have been declining. In 1998-99, the crude birth rate for Native Americans was 23.0 per 1,000, and the crude death rate was 5.7 per 1,000 for a natural increase of 1.2% per year. In 1970, the average number of children for Native American families was 4.6. The number declined to a low of 2.7 in 1976, but has slowly risen since that year. The average number of children in 1990 had returned to a peak of about 3.9 children per family. In 1999, the average Native American household in Alaska has plateaued at about 3.2 children per family, a number that is still above the 1976 low.

In contrast, the size of White families in Alaska generally has been relatively stable since the mid-1970s. The crude birth rate for Whites in 1998-99 was 14.0 per thousand, and the crude death rate was 4.0 per thousand, for a natural increase of 1.0%. The average number of children reached a high of about 2.3 per family in the early 1980s and rose higher still to 2.4 in the early 1990s. The average White family size has declined only slightly, back to about 2.3 children per family by 1999, a level comparable to the early 1970s. The low point for White fertility came during the economic recession of the late 1980s, when White families were averaging close to 2.0 children per family.

The crude birth rate for African-Americans in Alaska in 1998-99 was 15.4 per thousand, and the death rate was 2.4 per thousand, a natural increase of 1.3% per year. Similarly, the crude birth rate for Asian and Pacific Islanders was 19.8 per thousand, and the death rate was 2.4 per thousand, for a natural increase of 1.7%. The average number of children per family in 1998-99 was 1.9 for African-Americans and 2.2 for Asian and Pacific Islanders. Estimates of African-American and Asian birth statistics are currently somewhat questionable because of a change in the way in which births are classified by race. The overall fertility of both groups also has been affected by the decline in military population in the 1990s.

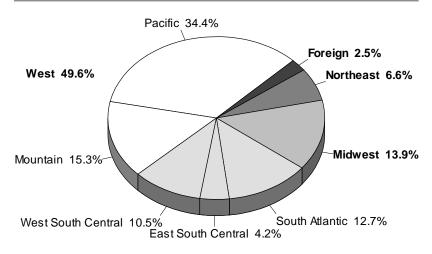

Figure 1.2 Components of Population Change for Alaska, 1946-1999

### Historical Migration to and from Alaska

As seen in Figure 1.2, migration to or from Alaska has varied widely from year to year. There are no readily identifiable typical migration patterns for the state. Rapid growth occurred during and after World War II, represented by an influx of 12,710 persons, or a 12.7% rate of proportional growth due to migration for 1946-47. The highest post-World War II proportional growth due to migration occurred

during the build-up for the Korean War in 1950-51 with in-migration of 20,100 persons producing a 14.7% rate of growth; and in 1951-52, with 21,680 immigrants resulting in a 13.6% growth rate. These high percentages were partly related to the small population base in these years. While the net migration for 1981-82 and 1982-83 was numerically larger than that for 1950-51 and 1951-52, it was proportionally much smaller. By 1983-84, the net influx of 24,900 immigrants accounted for only a 5.0% increase in the population.

The largest single numerical increase due to migration, 30,222 persons, or an 8.7% growth rate, occurred during pipeline construction in 1974-75. A severe economic recession led to the largest numerical loss, 19,245 out-migrants or a -3.5% population decrease, in 1986-87 and was larger than the 13,414 out-migrants, or -3.2% loss, which occurred at the end of the pipeline construction in 1977-78.

Historically, the majority of growth from migration in the U.S. occurs in relatively few of the 3,143 counties. Most communities in the U.S. attract relatively few immigrants each year. Nationally, the highest rates of movement are found among young adults in their twenties. About one-third of persons 20-29 years old moved the previous year. This rate was twice the annual rate found for all persons one year and over. The movement of persons in their twenties also accounts for the fact that about a quarter of all persons under five years of age also moved in the previous year. Most of the movement of young adults is to college, military or first job. Moving rates continue to decline with increasing age.

### Recent Migration Trends and Characteristics

Statistics on the movement of people between states and counties are derived from change of address on U.S. Internal Revenue Service tax returns. Alaska tends to have among the highest levels of migration to and from the state, and gross migration of any state in the union. Information on the characteristics of migrants is derived from the 1990 census.

Migration to and from the state is partly dependent upon federal military and program policies, which tend to result from unique historical events rather than easily predictable trends. The overall economies of the Pacific and Mountain regions relative to that of Alaska strongly influence migration to and from this state. When employment in Washington, California and Oregon becomes relatively weak, there is a greater tendency to look to Alaska for opportunity and vice versa.

As shown in part in Table 1.2, changes in migration to or from Alaska are more a result of the decline of migrants to Alaska than to changes in out-migration. A net loss or gain results from an increase or decrease in the number of in-migrants relative to out-migrants. The higher the rate of gross migration or turnover, the more unstable the population. Thus, one cannot always tell by observing what appears to be a net gain or loss of population whether changes of in-migration or out-migration are the cause. What appears to be massive out-migration may be a normal seven to eight percent out-migration with a sharp decline of in-migrants to the state.

Most of the fluctuation of migrants is accounted for by non-Native migration to or from the state. While there has historically been a moderate migration flow of Alaska Natives to and from the state each year, the flows have been fairly balanced. The net effect has been very little gain or loss of Alaska Natives as a result of migration outside the state.

The vast majority of all persons living in Alaska at the time of the census in 1990 were migrants to Alaska. Only 34.0% of Alaskans were born in the state. Regionally, these proportions varied from a low of 14.1% born in Alaska in Aleutians West Census Area, which was dominated by the Adak Naval Base and the highly transient city of Unalaska, to a high of 93.6% for Wade Hampton Census Area. Generally, over 75 percent of the residents of rural Alaska were born in Alaska, compared to 26.6% for Anchorage, 25.9% for Fairbanks and from 31 to 32 percent for Matanuska-Susitna, Kenai and Juneau. Statewide, of those born outside the state, 24.7% of the population were born in the West, 15.7% in the Midwest, 12.7% in the South, and 6.8% in the Northeast. Another 1.6% were born abroad to American parents and 4.5% were foreign born.

Gross migration is the total volume of migration to and from the state that occurs in a year. This is the statistic often used by businesses that depend on turnover of population for their activity, such as shipping companies, moving companies and realtors. These flows are shown in Tables 1.2 and 1.3 and Figures 1.3 and 1.4. On average, Alaska has one of the highest levels of gross migration of any state. Only the District of Columbia and Nevada are higher. During the 1980s, gross migration ranged from a high of 110,500 during 1985-86 to a low of 84,500 in 1987-88. On average during the 1980s, gross migration represents a number of migrants equal to 18.9% of the state's population each year. The range was between 15 and 22 percent.

Each year between 1980 and 1990 the number of in-migrants averaged 9.9% of the state's population. This number ranged from a low of 6.2% to a high of 13.6%. Similarly, an average number equal to 9.0%

of the state's population left Alaska each year. Outmigrants ranged from a low of 8.3% to 10.3% of the population. Armed Forces rotation probably accounted for one-fifth of these migration flows statewide each year. Flows to or from certain states with key bases are a regular part of the overall migration to or from Alaska, and in some instances strongly influence the importance of certain states in the pattern of migration to or from Alaska.

21

During the 1990s, in-migration flows averaged 7.3% of the state's population. The rate ranged from a high of 9.0% in 1991-92 to a low of 6.1% this past year. Out-migration averaged 7.2% during this nine-year period, but was more consistent each year. The movement out of state varied by only 1.4% from the highest rate to the lowest. The gross migration rate for 1998-99 was 12.6%. This rate was substantially less than the 22.3% gross migration rate experienced in 1981-82. The general slowdown of migration reflects positive economic conditions, both within the state and nationwide. If jobs and economic opportunity are available close to home, the tendency to relocate in search of work is diminished.

Migration to and from Alaska by geographic region of the United States has been relatively consistent over time. During the 1980s, Alaska's average gross

Figure 1.5
Alaska Population by Age,
Race and Male/Female, 1999

Source: Alaska Department of Labor and Workforce Development, Research and Analysis Section, Demographics Unit.

migration was 49.6% with the West; 27.4% with the South; 13.9% with the Midwest; and 6.6% with the Northeast. These regional proportions generally varied by less than two to three percentage points over the course of the decade as shown in Table 1.3.

In 1997-98, the most recent period for which Internal Revenue Service data are available, 46.9% of gross migration was between Alaska and the West, of which 29.4% was with the Pacific states and 17.5% to or from the Mountain states. Of the Pacific states, Washington accounted for 12.5%, California 9.5% and Oregon 5.9% of the migration. The share to and from Washington and California has tended to decline slightly over time and the share with the southern mountain states has tended to increase.

Similarly, in 1997-98, the South contributed 30.3% of Alaska's gross migration, an increasing flow to or from virtually all areas in the region compared to earlier years. Of the Southern flows, 14.6% were to or from the South Atlantic region, and 11.2% were to or from the West-South-Central region. The single southern state contributing most to Alaska's migration was Texas with 7.0%, a flow jointly associated with the oil industry and the military. At the same time, migration to or from the Midwest at 12.6% and the Northeast at 5.9% has declined. Alaska's migration to or from foreign countries has increased in one year from 3.6% to 4.3%. This is the highest rate since a level of 4.9% was reported in 1991-92. This movement is largely a combination of immigration and military rotations to or from overseas bases. Foreign immigrants, who currently number about 1,200 per year, continue to be a larger share of all migration to Alaska in the 1990s than in the 1980s.

## Population Composition: Historical Race Composition

Prior to the 1929 territorial census, little reliable data were available on Alaska's Native Americans. In 1929, some 29,983 Native Americans made up 50.6% of the state's population. Although their numbers have grown rapidly since 1929, the non-Native population has grown more rapidly, resulting in a gradual decline in the proportion of Alaska's population who are Native American. Since 1990, however, the proportion of Native Americans has slowly increased from 15.7% to 16.8% (Table 1.4) as a result of military cutbacks and the overall slowing of non-Native migration to Alaska.

Looking at 1990 census data before it was modified to correct for age and race problems, the census showed that 134,551 persons, or 24.5% of the population of Alaska, considered themselves to be some race other than White. The number and proportions of persons by race and broad tribal group for 1980 and 1990 are shown in Table 1.5. Of the

550,043 persons in Alaska in 1990, Native Americans made up 85,698. For these estimates, all Native Americans living in Alaska are referred to as Alaska Natives, even though a small percentage of them belong to continental U.S. tribal groups. Approximately half of the Native Americans belonging to tribes from the lower contiguous 48 states were born in Alaska. On the other hand, about 20 percent of all Alaska Natives are estimated to be living outside of Alaska. The economic boom of the early 1980s brought many non-Natives to the state. As a result, the proportion of Alaska Natives dropped from 16.0% in 1980 to 15.7% in 1990. Alaska Natives made up 4.4% of all Native Americans nationally in 1990.

The White population accounted for 415,492 persons, or 75.5% of the population, in 1990. Other races, primarily African-American, Asian and Pacific Islanders, accounted for 48,853 persons, or 8.9% of the 1990 population. These groups were up from

27,521, or 6.8%, in 1980. In 1990, there were some 17,803 persons of Hispanic origin in Alaska.

### **Current Population Composition**

The July 1999 state estimates are based on the April 1, 1990, Modified Age, Race, Sex (MARS) estimates. As stated earlier, the MARS estimates adjust the census race data to eliminate "other races" and adjust for errors in age reporting at the time of the census. The 1991 to 1999 estimates by age/race/male/female and ethnicity are presented in Tables 1.6 through 1.20. The 1990 MARS estimates are shown in Tables 1.21, 2.4 and 2.5. Detailed single year-of-age estimates are available from the Alaska Department of Labor and Workforce Development, Research and Analysis Section, Demographics Unit.

The size of each age group in the population is affected by its birth, death and migration history and life cycle events. These patterns can be seen in Figures 1.5 and 1.6. For Alaska, the largest factor affecting change in the size of each age group is migration. Migration is particularly high for 18-to-35 year olds and their young children under school age. Migration began to increase sharply during the 1970s. This accounts for much of the dramatic increase in persons over 40. The large bulge at ages 35-45 was created by the 1980-90 migration to Alaska. The age structure of Alaska's population compared to that of the U.S. as a whole can be seen in Figure 1.7.

### **Specific Age Groups**

The growth trends for various age groups often differ sharply from those of the population as a whole. These differences in age groups are found in Table 1.22 and Figures 1.8 and 1.9.

While Alaska's total population increased 13.1% between July 1, 1990 and July 1, 1999, children under the age of five declined 8.5%, from 55,859 to 51,111. This age group currently makes up 8.2% of the state's population. Since 1989, the number of young children increased to a high of 58,200 in 1993, but has steadily declined in the last six years. The number in this age group is extremely volatile, depending on economic conditions. As a result, children under five are generally unreliable as a planning indicator for future elementary school facilities because economic booms and busts can quickly change the size of this age group. Cutbacks in military personnel and the net loss of young adults due to the low in-migration have acted to reduce the number of young children in the state.

The population aged five to 13 are the children of elementary and junior high school age. They represent the peak of the echo boom; that is, they

are the children of the last of the baby boomers. Peak baby boomers born in the early 1950s and 1960s tended to get married later and postpone childbearing. These echo boom children have increased to 100,645 in 1999, from 87,602 in 1990. While the numbers have increased nearly 15 percent, the proportion of the population in this age group has increased only 0.4%; from 15.8% in 1990 to 16.2% in 1999. This group will continue to put pressure on high school enrollments over the next few years; however, this age group is expected to stabilize or begin declining unless Alaska experiences another economic boom.

High-school-age children have tended to be more stable over the years. Alaska's adult population has traditionally been too young to have large numbers of high-school-age children. However, their numbers have increased steadily since 1990. In 1999, there were 41,889 youth aged 14-17 in Alaska, up from 30,356 in 1990. This age group has increased from 5.5% of the state's population in 1990 to 6.7% in 1999. In general, teenagers are less subject to changes in migration flows than younger age groups because their parents are older and generally have more stable jobs. Cutbacks in long-standing oil and government jobs, however, could negatively impact this group. Alaska should continue in the near future to see a slight increase in pressure on high school facilities from this age group.

The age group 18-24 is most subject to increases and declines in economic conditions. While nationwide this group was declining, in Alaska it reached a high of 70,175 in 1984. Since 1984, this group decreased to 56,189 by 1990, a loss of 20 percent in six years. Between 1990-1999, this age group shrank another 5.4% to 53,140. Cuts in the military population have influenced the downward trend in this age group. This group also represents the children born following the end of the baby boom in the early 1970s when fertility hit an all time low. In part, the small size of this segment of population in conjunction with a generally healthy economy can be credited with the low unemployment rates currently being seen in Alaska as well as nationwide. This group should generally have better economic prospects than did their predecessors. The increased demand for labor that attends this smaller generation is creating a unique opportunity to increase the employability of persons not currently in the labor force. Thus, the current tight labor market is likely to begin turning around as the echo boomers enter the labor market in the next few years.

The population aged 25-34 is composed of young adults in the prime ages for family and household formation. It is estimated that this age group peaked in Alaska at 128,401 in 1986. The families in this

age group contribute heavily to the number of children under five years of age. This is the age group that has been most affected by the recent military cutbacks in Alaska. By 1990, the persons in this age category numbered 113,233, a loss of 11.8% of young householders since 1986. This age group continued to decrease to 84,518 between 1990 to 1999. As the baby boomers moved out of it, this age group declined from 23.7% of the state's population in the early 1980s to just 13.6% in 1999.

Since 1980, faster than average growth occurred in population ages 35-44. This age group represents what is now the core of the baby boom generation; defined as individuals born between 1946-1964. Inmigration of more established families during the 1980s added to the numbers of this naturally large population cohort. In spite of overall losses in the state's population due to the severe economic recession in the 1986-87 period, this age group

(continued on page 53)

(continued from page 25) continued to grow, reaching its highest level of 120,566 persons in 1996. Currently, about one in five Alaskans falls into this four-year age category.

The ages 45-54 include the leading edge of the post World War II baby boom. This age group segment of the population grew in Alaska from 8.5% in 1980 to 15.2% in 1999. As of July 1, 1999, there were an estimated 94,496 persons 45-54 years old. In general, middle-aged Alaskans have been more willing to stay in Alaska in recent years than in prior decades.

The ages 55-64 have traditionally been the ages at which many Alaskans begin to move south. This age group's share of Alaska's population has shown small, but steady increases since 1985 as their numbers have increased by 55%. This age group should grow rapidly in Alaska over the next 10 years as the baby boomers begin to enter their mid-fifties. There were 43,437 persons 55-64 in the state in 1999.

Persons 65 years old and older numbered 33,641 in 1999. Considering the size of the population currently 55-64, the number of senior Alaskans will continue to increase in coming years. Large numbers of persons over age 40 are also reaching the point in the life cycle where they are beginning to have older parents to care for. Such care, in some cases, is more easily provided in Alaska than by long distance in other states. In-migration of older persons to Alaska, however, remains a very tiny part of either growth or migration. Since 1980, the segment of population 65 years and older has increased 191%. The rate of growth between 1990-1999 by itself totaled 50%. The rate of Alaska's increase tops that of any other state. In spite of the rapid rate of increase, Alaska has by far the smallest proportion of persons 65 and over (5.4%) in the nation. The next smallest percentage is in Utah (8.8%). The average percentage of the population over 65 for the U.S. is 12.7%.

#### **Median Age**

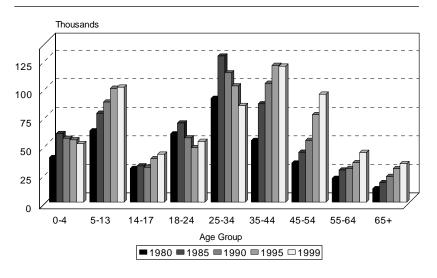

The population in Alaska is younger than the national average but, because of recent migration, this gap is narrowing. The 1999 median age in the United States was 35.6, while the median age for Alaska was 32.9 years. By race, the median ages of Alaskans are: White 35.4, Native American 23.3, African-American 27.0, and Asian and Pacific Islanders 31.4. The median age of Hispanics is 27.8. The Native American population is much younger because of its high fertility rate. The African-American population is young because it is largely military. The 1999 median ages by race for the United States as a whole were: White 36.6, Native American 27.6, African-American 30.1, and Asian and Pacific Islanders 31.7.

Nationwide, the median age of Hispanics was 26.5. Alaska had the second youngest population in the U.S., after Utah, where the median age was about 26.7 in 1998.

## Voting Age Population

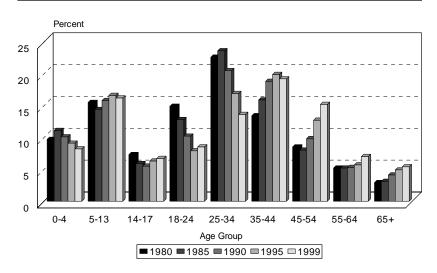

The July 1, 1999 estimate of voting age population, those over 18 years old in Alaska, was 428,355. Of that population, Whites made up 326,860 (76.3%),

Figure 1.9
Alaska Population by Age Group,
Percent Distribution, Selected Years 1980 to 1999

Alaska Natives 61,537 (14.4%), Asian and Pacific Islanders 21,103 (4.9%) and African-Americans 18,857 (4.4%). There were an estimated 18,894 (4.4%) voting-aged persons of Hispanic origin. Hispanics may be of any race.

According to the Division of Elections, as of July 1, 1999 there were 468,153 registered voters in the state. Thus, a number of registered voters equivalent to over 109% of the eligible voting age population are currently on the voter registration rolls. Alaska has only recently been able to purge voter registration rolls, and a 12% gross migration each year means that the number of persons on the registers are not a valid measure of the proportion of eligible voters who are registered. To the degree that the number of persons who cast ballots in the November 3, 1998 general election represented the persons eligible to vote, approximately 50.3 percent of those eligible to vote actually voted. More detailed data on age of population by election district are shown in Table 3.3.

## **Dependency**

Dependency ratios show how large a burden of support is placed on the working age population by the young and the old. In 1999, every 100 Alaskans of working age supported 49.1 children under 18 years of age and 8.5 persons over 65. In this same year, every 100 persons of working age in the United States as a whole supported 41.8 children and 20.6 persons over 65. Thus, working Alaskans have less of

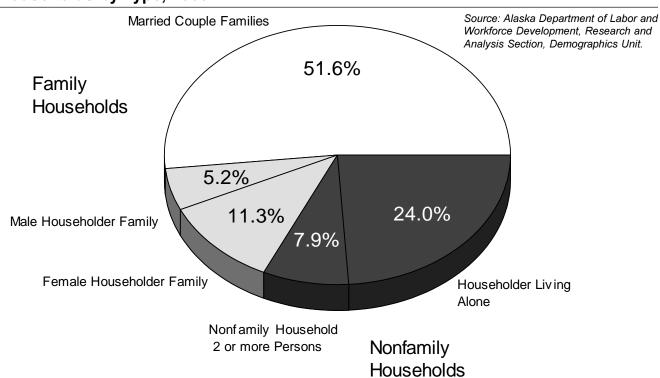

a dependency burden than the average American. While we have a higher burden placed by children, we have a much lower burden placed by elders. It is important to note that the dependency burden for White Alaskans is far less than that for Native Americans. Every 100 Alaska Native persons of working age must support 87.2 additional persons compared to 52.1 for Whites. This added burden is exacerbated by the higher unemployment, lower labor force participation and lower incomes of many Alaska Natives.

## **Male/Female Composition**

In July of 1999, an estimated 298,313 persons, or 48.0% of Alaska's population, were female, compared to 51.1% nationwide. Considered another way, there were 108.5 males for every 100 females in Alaska in 1999. By race, there were 110.7 White, 100.2 Native American, 127.9 African-American, and 91.9 Asian and Pacific Islander, males for every 100 females in each racial group. The higher ratio for African-Americans tends to be a reflection of the large number of young African-American males in the military. Other states with high male/female ratios are Nevada 104, Wyoming 101, Hawaii 101, Idaho 100 and California 100 males for every 100 females.

While Alaska continues to have the lowest overall percentage of women of any state, the difference has often been greatly exaggerated in the popular press. A few Alaska communities tend to be more heavily

Figure 1.10 Alaska Households by Type, 1999

male because employment is transient or concentrated in occupations that traditionally have employed mostly males. Military installations and logging, fishing, or mining operations are the main sources of distortion of these ratios. Most communities, however, have male/female ratios more in line with the rest of the nation.

Within the state, the highest ratio of males to females is in the age group 50-54 at 118.9 males per 100 females. Ages 30-34 are close behind with a ratio of 117.8 males per 100 females. The next highest male/female ratios by age in 1999 occurred among the groups aged 60-64, 45-49, 25-29, 35-39, where the ratios were 115.6, 113.5, 111.5 and 110.5 respectively. These ages continue to reflect the male/ female pattern of migration at an earlier period in Alaska history. The relatively young age of Alaska's population also adds slightly to the overall male proportion. States with significant older populations, like Pennsylvania (median age 37.6), have more women because of the greater life expectancy among women. The male/female ratio in Pennsylvania is about 93 men for every 100 women.

# Alaska Households and Living Arrangements

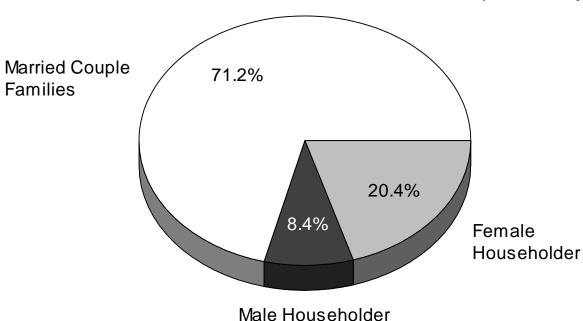

The census counts all persons as living either in households or group quarters. A household occupies a housing unit. The census currently defines a housing unit as a house, an apartment, a group of rooms or a single room intended as separate living

quarters. Boats, tents, vans, and caves are included if they are occupied as a usual place of residence. Mobile homes are included provided they are intended for occupancy on the site where they stand. Seasonal residences, forest service cabins, or vacant cabins that are habitable are included in the inventory.

The 1990 census counted some 232,608 housing units in Alaska, with 188,915 occupied and 43,693 vacant. Some 16,991, or 39%, of the vacant housing units were for seasonal, recreational or occasional use. In 1980, the census counted 162,825 housing units, with 131,463 occupied and 31,362 vacant. There was an increase of 69,783 total housing units during the decade, or a growth of 42.9%. The number of occupied housing units or households in Alaska increased by 57,452, or 43.7%, during the decade.

The vacancy rate for 1990 declined to 18.8% compared to 19.3% in 1980. Since the population of the state grew by 36.9% during the decade, housing and household growth outstripped the growth of population. Following the national trend, the number of persons per household in Alaska declined by 0.13 person, from 2.93 in 1980 to 2.80 in 1990. During the same period, in the nation as a whole, persons per household declined by 0.12 person, from 2.75 in 1980 to 2.63 in 1990.

Alaska Department of Labor and Workforce Development, Research and Analysis Section, Demographics Unit.

All persons not living in households live in group quarters. Two general categories of persons in group quarters are recognized: (1) institutionalized persons (such as those in prisons, nursing homes, psychiatric hospitals and residential treatment facilities) and (2) other persons in group quarters (such as those in group homes, college dorms, military barracks, fish processing and logging camp bunkhouses and emergency shelters). Some 20,701 persons lived in group-quarters housing in Alaska in 1990. Due largely to cutbacks of military personnel and the move away from barracks-type housing in the military, the number of persons occupying this type of housing in 1999 decreased to 17,180. A more detailed discussion of living quarters appears in Chapter 2.

Households are broken down into family households and non-family households. A household containing a householder and one or more persons related by birth or marriage makes up a family household. By census definition, not all households contain families. A household composed of two or more unrelated individuals or one person living alone is considered a non-family household. The number of persons in households is shown in Table 1.23 and Figures 1.10 and 1.11.

Some 529,342 persons lived in 188,915 households in Alaska in 1990. Of that population, 454,726 persons, or 82.7%, lived in 132,837 family households. The remaining 74,616 persons, or 13.6%, lived in 56,078 non-family households. Overall, 70.3% of all households were family households and and 29.7% were non-family households. In 1999, an estimated 225,634 households existed in Alaska. Of these, 153,695, or 68.1%, were family households and 71,939, or 31.9%, were non-family households. Households in the United States in 1998 (latest information available) were 69.1% family and 30.9% non-family. The proportion of persons in family households continues to decline nationwide.

Family household types are husband-wife, maleheaded and female-headed households. A married couple household is a family in which the householder and spouse are counted as members of the same household. Male- and female-headed households consist of a single adult head and at least one younger or older related dependent. Of Alaska's 132,837 family households in 1990, 106,079 were husband-wife, 8,529 were male-headed, and 18,229 were female-headed. These comprised 56.2%, 4.5% and 9.6% of all households respectively. In 1999, it was estimated that there were 117,272 married couple households, 11,290 male-headed households

and 24,502 female-headed households in Alaska. These made up 52.8%, 5.3% and 10.6% of all households in the state.

Alaska's households are about as likely to contain married couple families and slightly more likely to contain a male-headed household with no spouse present than households of the nation as a whole. Nationwide, 53.0% of all households are married couple; 3.8% are male-headed; and 12.3% female-headed.

In 1990, Alaska had 85,094 households with related children. Of these related-children households, 64,720, or 76.1%, were in married-couple families. A single-female householder was present in 14,625, or 17.2%, of the households with related children, and a single-male householder was present in 5,749, or 6.8%, of the households with related children.

There were an estimated 98,966 households within Alaska in 1999 with related children. Of these, an estimated 70,407, or 71.1%, were married couple families; 20,211, or 20.4%, female-headed families; and 8,348, or 8.4%, male-headed families. Only 43.9% of all households contained related children under the age of 18. Of all households containing children living with one parent in 1999, an estimated 29.2% were male-headed households and 70.8% were female-headed households.

Traditional households containing a husband, wife and related children made up only 31.2% of all households in Alaska. This is noticeably higher than the national average of 24.9% in 1999. In part, this reflects Alaska's younger population and higher fertility. Between 1980 and 1999, the proportion of households with children living with married couple families declined, while the proportion of female-and male-headed households with children increased.

Persons living alone or unrelated persons living together account for the non-family households. Of the 56,078 non-family households in 1990, 41,826 contained persons living alone, and 14,252 contained unrelated persons living together. In 1999, of an estimated 71,939 non-family households in Alaska, 54,145 (30.0% of all households) contained persons living alone, and an additional 17,793 (7.9% of all households) contained two or more unrelated individuals. Since 1990, these rates in the state have gradually increased. Nationwide, the proportion of households containing a single person living alone was 21.7%, and the proportion of households containing two or more unrelated individuals was 9.5% in 1999.
